AlpaTrade — buy_the_dip walk-forward (Mag-7, PnL objective)

Generated 2026-07-20 10:54 UTC · basket AAPL, MSFT, GOOGL, AMZN, META, TSLA, NVDA · $10,000/fold · train 60d → test 30d, rolling · 8 folds

Each fold: optimise the grid on the **train** window by **PnL**, then trade that exact config on the next, unseen **test** window. **OOS PnL** is the honest number — money the just-optimised config made on data it never saw. Naive = a fixed default config, untouched.

Fold-by-fold (out-of-sample)

Test window	Chosen dip/TP/hold	In-sample PnL	OOS PnL	OOS trades	Naive PnL
2025-11-22→2025-12-22	0.03/0.015/3	$4,457	**$3,256**	88	$1,896
2025-12-22→2026-01-21	0.03/0.015/1	$3,594	**$3,882**	80	$3,882
2026-01-21→2026-02-20	0.03/0.015/1	$4,538	**$4,148**	107	$3,677
2026-02-20→2026-03-22	0.03/0.015/2	$4,280	**$4,030**	118	$3,665
2026-03-22→2026-04-21	0.03/0.01/1	$4,291	**$1,846**	86	$211
2026-04-21→2026-05-21	0.03/0.015/1	$2,049	**$2,850**	68	$1,546
2026-05-21→2026-06-20	0.03/0.015/1	$3,149	**$4,319**	106	$4,340
2026-06-20→2026-07-20	0.03/0.015/2	$4,566	**$3,219**	93	$945
Total		$30,924	**$27,550**		$20,162

Verdict (PnL)

- **Out-of-sample PnL: $27,550** across 8 folds ($10,000/fold), profitable in **8/8** folds.
- In-sample PnL was $30,924. The **IS→OOS drop of $3,374** (11% of in-sample) is the over-fit tax — how much the grid-optimised number

overstates reality.
- vs a fixed naive config ($20,162 OOS): optimising per fold BEAT the fixed naive config out-of-sample — the tuning adds real PnL.
- Bottom line: **$27,550 of realistic (out-of-sample) PnL** is the number to trust, not the $30,924 in-sample figure.

Caveats

- Still uses the backtester's fill/fee model; OOS removes *window* over-fit but not idealised execution. Real fills/slippage would reduce this further.
- Each fold is a fresh $10k (not compounded). Hypothetical; not financial advice.

Storage & reproduce

- All train + test runs persist to `alpatrade.runs/backtest_summaries/trades`.
- Reproduce: `python scripts/walk_forward_btd.py`.
